

Calculus(I)

$$x^2 - 3x - 4 = 0$$

$$4x^2 - 3x - 1 = 0$$

$$\frac{d}{dx} \left[\frac{f(x)}{g(x)} \right] = \frac{g(x)f'(x) - f(x)g'(x)}{g(x)^2}$$

$$F = mg = ma = m \frac{d^2h}{dt^2}$$

Gottfried Wilhelm Leibniz

$$\frac{dA}{dt} = \frac{dB}{dt} = -\frac{dC}{dt} = \frac{dD}{dt} = (c_1)T^{\frac{1}{2}}AB - (c_2)T^{\frac{1}{2}}CD$$

$$m \frac{d^2x}{dt^2} = -kx - f \frac{dx}{dt} + A \sin(\omega t)$$

$$y' = \text{and } v' = -ky - fv + A \sin(\omega t)$$

$$m \frac{d^2x}{dt^2} = -kx$$

$$x = A \frac{dT}{dt} - (c_1)(T - T)$$

$$\frac{df(x)}{dx}$$

$$\frac{b^2 - 4ac}{4a^2}$$

$$x + \frac{b}{2a} = \frac{\sqrt{b^2 - 4ac}}{2a}$$

$$x + \frac{b}{2a} = -\frac{\sqrt{b^2 - 4ac}}{2a}$$

$$cx + h, f(x) + i$$

3.2 Monotonicity and Concavity

Lecturer: Xue Deng

How to determine the monotonicity and concavity of a function?

By the **signs** of the **first** derivative and **second** derivative of function!

Definition of Monotonicity

Let f be defined on an interval I (open, closed, or neither). We say that

(1)

f is **increasing** on I if, for every pair of number x_1 and x_2 in I ,

$$x_1 < x_2 \implies f(x_1) < f(x_2)$$

(2)

f is **decreasing** on I if, for every pair of number x_1 and x_2 in I ,

$$x_1 < x_2 \implies f(x_1) > f(x_2)$$

(3)

f is **strictly monotonic** on I if it is either increasing on I or decreasing on I .

Theorem of Monotonicity

Th A: Let f be continuous on an interval I and differentiable at every interior point of I

(i) If $f'(x) > 0$ for all x interior to I ,
then f is increasing on I . (See Figure 1)

Figure 1

(ii) If $f'(x) < 0$ for all x interior to I ,
then f is decreasing on I . (See Figure 2)

Figure 2

Definition of Concavity

Let f be differentiable on an open interval I

(1) We say that f is concave up on I if f' is increasing on I

(2) We say that f is concave down on I if f' is decreasing on I

Theorem of Concavity

Th B: Let f be twice differentiable on the open interval I

(i) If $f''(x) > 0$ for all x in I ,
then f is concave up on I .

$f'(x)$ increasing $f''(x) > 0$

Figure 1

(ii) If $f''(x) < 0$ for all x in I ,
then f is concave down on I .

$f'(x)$ decreasing $f''(x) < 0$

Figure 2

Definition of Inflection Point

Inflection Points :

Let f be continuous at c . We call $(c, f(c))$ an **inflection point** of the graph of f if f is concave up on one side of c and concave down on the other side.

Example 1

? If $y = e^x - x - 1$, find where f is increasing and where it is decreasing.

Domain is $(-\infty, +\infty)$.

$$\because y' = e^x - 1.$$

$$\therefore (-\infty, 0), \quad y' < 0,$$

$$(0, +\infty), \quad y' > 0,$$

\therefore The function is decreasing on $(-\infty, 0]$, increasing on $[0, +\infty)$.

Example 2

? If $f(x) = 2x^3 - 9x^2 + 12x - 3$, find where f is increasing and where it is decreasing.

Domain is $(-\infty, +\infty)$.

$$\begin{aligned}f'(x) &= 6x^2 - 18x + 12 \\ &= 6(x - 1)(x - 2)\end{aligned}$$

By solving the equation $f'(x) = 0$,

We conclude that $x_1 = 1, x_2 = 2$.

x	$(-\infty, 1)$	$(1, 2)$	$(2, +\infty)$
$f'(x)$	+	-	+
$f(x)$			

\therefore The function is **decreasing** on $[1, 2]$
increasing on $(-\infty, 1]$ and $[2, +\infty)$.

Example 3

? If $y = x^3$, find where y is concave up and where it is concave down.

$$\therefore y' = 3x^2, \quad y'' = 6x,$$

$$\therefore x < 0, \quad y'' < 0,$$

$\therefore y$ is concave down on $(-\infty, 0]$;

$$\therefore x > 0, \quad y'' > 0,$$

$\therefore y$ is concave up on $[0, +\infty)$.

The point $(0,0)$ is the inflection point from concaving up to concaving down

Example 4

? Where is $f(x) = \frac{1}{3}x^3 - x^2 - 3x + 4$ increasing, decreasing, concave up, concave down?

$$f'(x) = x^2 - 2x - 3 = (x + 1)(x - 3) \quad (x = -1 \text{ or } x = 3)$$

$$f''(x) = 2x - 2 = 2(x - 1) \quad (x = 1)$$

$(x + 1)(x - 3) > 0 \quad \therefore f$ is increasing on $(-\infty, -1]$ and $[3, \infty)$.

$(x + 1)(x - 3) < 0 \quad \therefore f$ is decreasing on $[-1, 3]$.

$2(x - 1) > 0 \quad \therefore f$ is concave up on $(1, \infty)$.

$2(x - 1) < 0 \quad \therefore f$ is concave down on $(-\infty, 1)$.

Example 5

? Find all points of inflection of $F(x) = x^{1/3} + 2$.

$$F'(x) = \frac{1}{3x^{2/3}}$$

$$F''(x) = \frac{-2}{9x^{5/3}}$$

The second derivative, $F''(x)$, is never 0;

However, it fails to exist at $x = 0$.

The point $(0,2)$ is an inflection point since $F''(x) > 0$ for $x < 0$ and $F''(x) < 0$ for $x > 0$.

Summary of Monotonicity and Concavity

Monotonicity Th

Let f be continuous on an interval I and differentiable at every interior point of I

- (1) If $f'(x) > 0$ for all x interior to I , then f is **increasing** on I .
- (2) If $f'(x) < 0$ for all x interior to I , then f is **decreasing** on I .

Concavity Th

Let f be twice differentiable on the open interval I

- (1) If $f''(x) > 0$ for all x in I , then f is **concave up** on I .
- (2) If $f''(x) < 0$ for all x in I , then f is **concave down** on I .

Questions and Answers

Q1: If $f(x) = 2x^3 - 3x^2 - 12x + 7$,
find where f is increasing and where it is decreasing.

$$\therefore f'(x) = 6x^2 - 6x - 12 = 6(x^2 - x - 2) = 6(x - 2)(x + 1),$$

\therefore The split points are -1 and 2 .

Table

x	$(-\infty, -1)$	$(-1, 2)$	$(2, +\infty)$
$f'(x)$	+	-	+
$f(x)$	\uparrow	\downarrow	\uparrow

$\therefore f(x)$ is increasing on $(-\infty, -1]$ and $[2, +\infty)$,

$f(x)$ is decreasing on $(-1, 2]$.

Questions and Answers

Q2: If $g(x) = \frac{x}{1+x^2}$, find where g is increasing and where g is decreasing.

 $\therefore g'(x) = \frac{(1-x)(1+x)}{(1+x^2)^2}$ \rightarrow numerator
 \rightarrow denominator is positive at everywhere

\therefore The split points are -1 and 1 .

$\therefore g(x)$ is increasing on $[-1, 1]$,

$g(x)$ is decreasing on $(-\infty, -1]$ and $[1, +\infty)$.
